

Abstract

A hand router having a housing (12) and having a tool (22) situated in it in a rotary drivable fashion, which it is possible to operate in the intended manner
5 by means of a suction air flow, in particular by means of a vacuum cleaner, is particularly powerful because a radial turbine wheel (32) equipped with intake and outlet gratings (44, 48) is used as the drive, the housing (12) being comprised of tube-like sections (13, 14, 15), in particular that can be grasped by an operating hand, which it is possible to connect with one another by means of
10 flanges (36, 38).
